

Advanced Terraform on AWS Lab0

Lab Setup

Lab Objectives

In this lab, you will:

- Launch and configure Visual Studio Code (VSC) in your lab virtual machine ahead of running subsequent labs
- Access AWS using provided credentials.

Teaching Points

This lab will configure your lab environment. The environment has a time limit of **36** hours after which it will be decommissioned. Use the '**Pause**' option at the end of each days training to ensure that the environment remains consistent for the entire duration of the course. If the lab expires, ends or is restarted, you may have to perform steps previously completed before progressing further.

Before you begin

These instructions assume you have accessed the QA Portal and have followed the instructions provided there. You should therefore have this screen in front of you before proceeding...

Task1 Set up your Lab environment

1. Open VSC  from the taskbar
2. Verify that the Hashicorp Terraform and VSCode-pdf VSC extensions are installed..

3. Verify **c:\qatfadvaws** has been added to Explorer;

These class files are available at <https://github.com/qatip/qatfadvaws.git> for post-class use.

Task 2 Logging into AWS

4. Open a new web browser tab and login to the AWS Console using your provided lab credentials. **Note:** This can be done from your local machine or on the remote desktop. The latter is recommended.
5. When required to run Terraform commands from VSC terminal, you will need to authenticate to AWS.
6. Type “**aws configure**” in a terminal session.
7. Use the AWS Access KEY ID and AWS Secret Access Key provided...

4. If you require an Access Key and Secret for your lab, use the following:

- Access Key: AKIAWJKSU*****1
- Secret : yS7h1WT4aKwUCCv8d*****H+Rvq8X2Wvy

8. Use “us-west-2” as your default region for this lab environment. If running these labs post-course then choose an appropriate region.

9. Leave Default output format blank.

10. These credentials are stored in **users/{username}/.aws**. You can re-run **aws configure** at any point to change these setting..

```
PS C:\qatfadvaws> aws configure
AWS Access Key ID [*****CBE2]:
AWS Secret Access Key [*****oqA+]:
Default region name [us-west-2]:
Default output format []:
```

Task 3 Arranging your remote desktop

11. In order to avoid the frustration of desktop clutter, it is suggested you arrange your desktop as shown below. In this way you can easily switch between your web browser, in which you can view your course manual, lab instructions, the AWS Console and any other web resources, and the VSC interface, in which you will create, and action terraform files.

You can view the lab instructions within VSC or through a browser, browsing to **c:\qatfadvaws\lab_instructions..**
